

Hiring Process Analytics

Description:

This project is based on analyzing a company's hiring process data to help it improve the performance on the hiring process more efficiently and make better hiring decisions in future.

It focuses on recognising patterns like rejection, understanding trends, and using of statistics and Excel to provide meaningful outcomes and insights to help improve the recruitment strategies and decision making.

Approach:

Firstly, I carefully went through the statistics dataset provided and opened it on Microsoft Excel. Then I started to explore the columns and the available information like status, department, post name etc.

After that I start my analysis on handling missing data like checking if there's any missing or blank values and how to handle them. Then clubbing the columns if there are multiple categories that can be combined and make the data more simplified. Then checking for outliers in the dataset and removing them if needed as per requirement.

And finally cleaning and preparing the raw data using statistical measures like calculating averages, making pivot tables and creating graphs or charts for visualisation of the data output and clean presentation to potentially help the company improve the hiring process and make better hiring decisions.

Tech-Stack Used:

Microsoft Excel – Used for data analysis, making pivot tables, statistical functions and data visualisation of the outputs to provide a clean presentation which would help in better decision making.

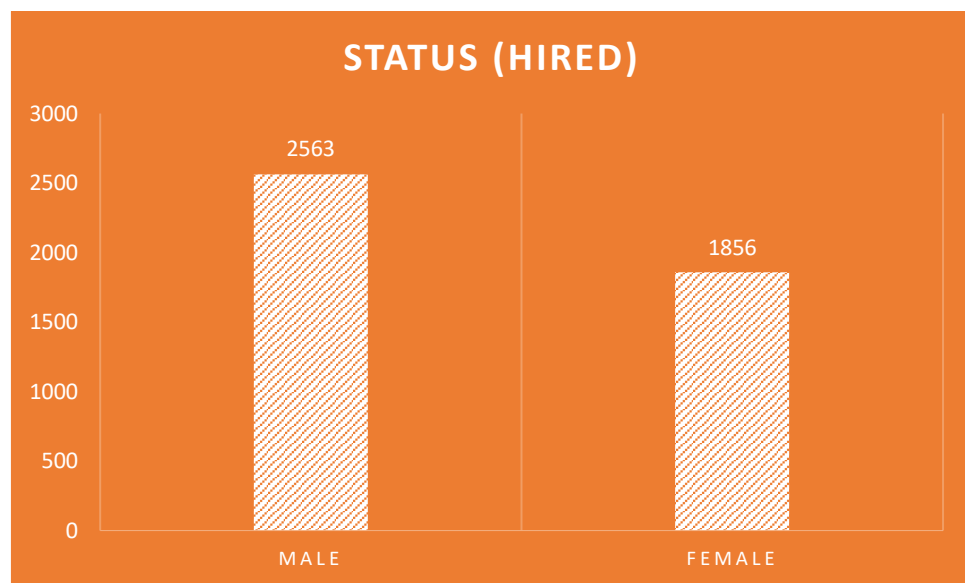

Microsoft Word / PDF - Used for documentation and presenting report of outputs and insights for better recruitment strategies and decision making.

Insights:

Hiring Analysis –

Gender	Status (Hired)
MALE	2563
FEMALE	1856

Males and Females hired by the company

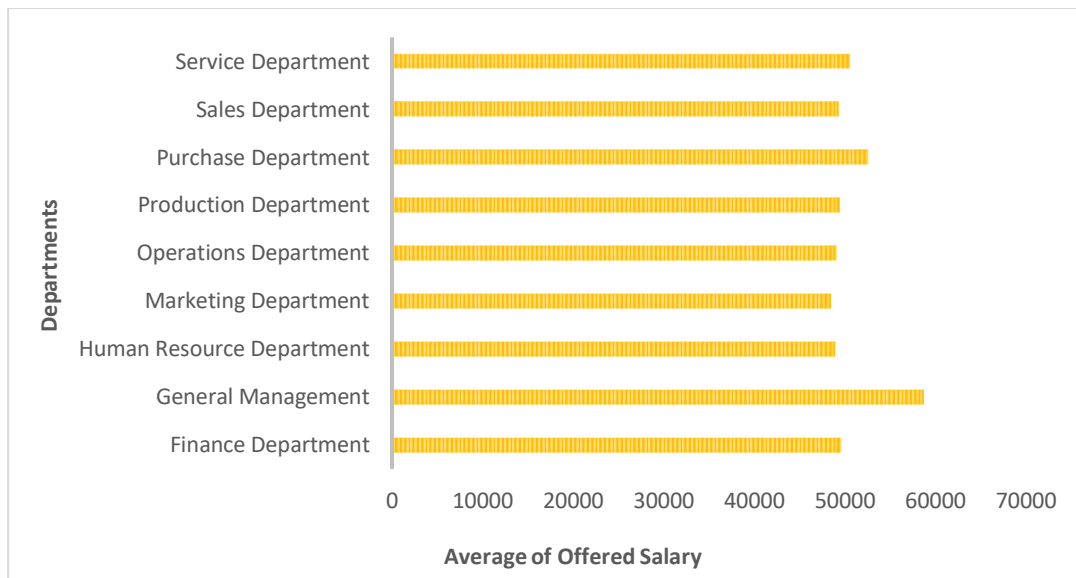

According to the output here, 2563 Males and 1856 Females have been hired by the company which represents the company hired more males compared to females.

Here the company should focus on making the gender ration equal for better reputation.

Salary Analysis –

Departments	Average of Offered Salary
Finance Department	49628.01
General Management	58722.09
Human Resource Department	49002.28
Marketing Department	48489.94
Operations Department	49151.35
Production Department	49448.48
Purchase Department	52564.77
Sales Department	49310.38
Service Department	50629.88
Grand Total	49983.03

Average salary offered by this company

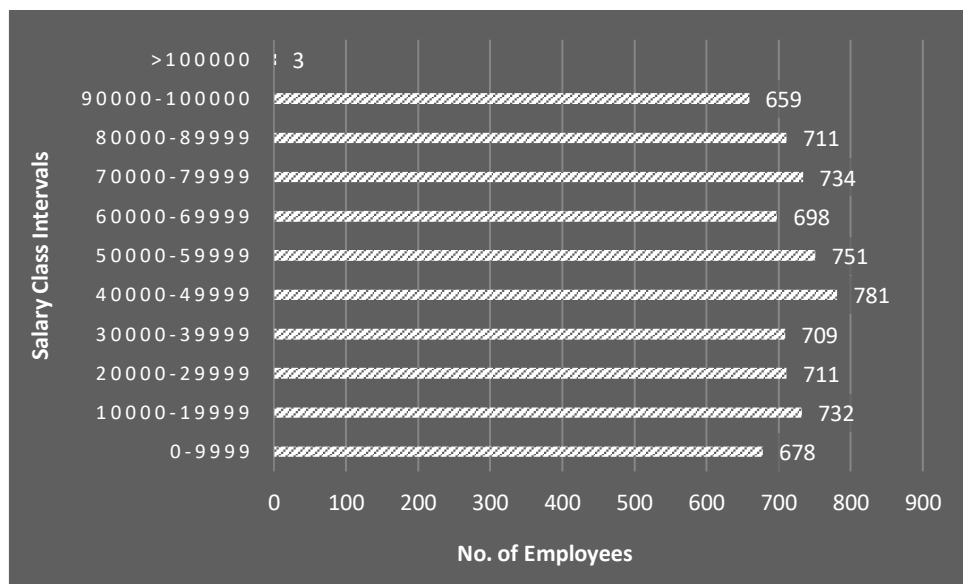

According to the output, the average salary offer by the company is 49983.03. The structure of the salary here shows that it's having balance across all the departments. Also representing that the General Management department has the highest average salary offer.

Here there was a missing value in the salary field and after removing it the average comes as 49878.33 which indicated no major difference.

Salary Distribution –

Salary Class Intervals	No. of Employees
0-9999	678
10000-19999	732
20000-29999	711
30000-39999	709
40000-49999	781
50000-59999	751
60000-69999	698
70000-79999	734
80000-89999	711
90000-100000	659
>100000	3

Class intervals for the salaries in the company

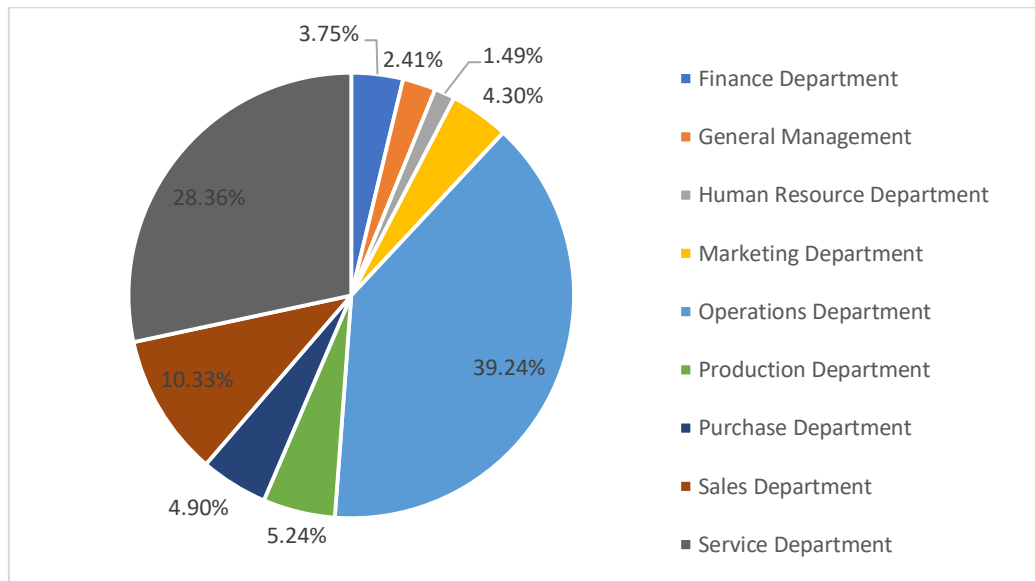

According to the output, most employees fall within the salary range of 40,000 to 50,000. Also, it represents that above 100,000 there are only 3 employees which indicates the lead roles and the company focus on hiring entry or mid-level employees.

By this it represents the salary distribution between the upper and lower limits.

Departmental Analysis –

Department	No. of people working (Hired)
Finance Department	176
General Management	113
Human Resource Department	70
Marketing Department	202
Operations Department	1843
Production Department	246
Purchase Department	230
Sales Department	485
Service Department	1332

Proportion of people working in different departments

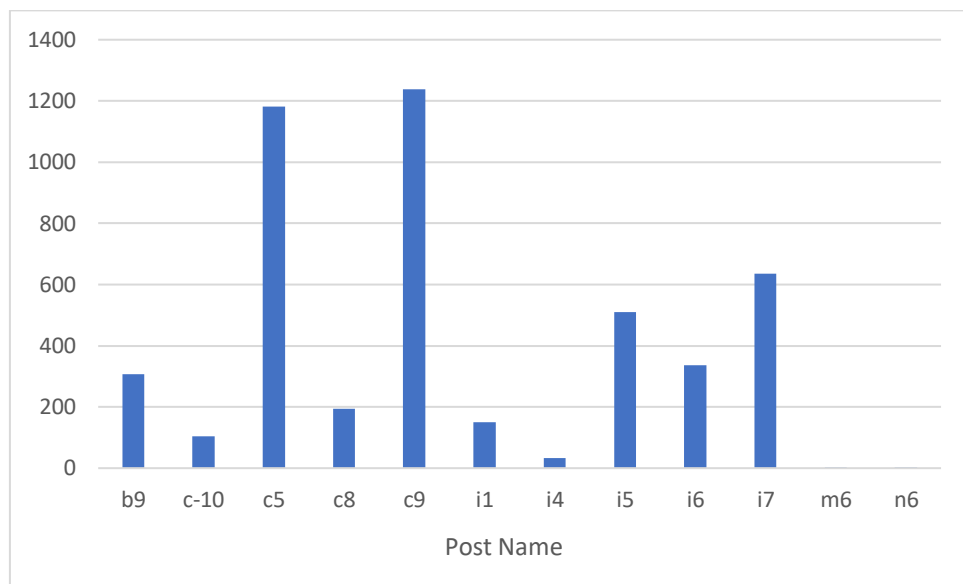

According to the output, it clearly represents that the Operations Department have the maximum number of employees followed by the Service Department which indicates that the company is majorly operation and service based. The department with the least number of employees is the Human Resource Department.

Here the company should also focus on the department with lower proportion of people working to have a better workflow and balance.

Position Tier Analysis –

Post name	Distribution (Hired)
b9	308
c-10	105
c5	1182
c8	193
c9	1239
i1	151
i4	32
i5	511
i6	337
i7	635
m6	2
n6	1

Different position tiers within the company

According to the output here, the position tiers c9 and c5 have the highest number of hired employees, whereas the position tiers m6 and n6 represents the least number of hired employees.

Here this data could be used for a better growth opportunity.

Result:

From this project, the importance of the hiring process while understanding patterns and trends were noticed. Along with that I presented meaningful insights and data visualisation which helped in improving the process and better decision making.

This project also helped me enhance my knowledge of statistics and Excel using functions for cleaning the raw data into insights, making pivot tables and creating charts for data visualisation and clean presentation.
